

Gap Analysis

i This document compares the current business environment (As-Is) with the desired future state (To-Be) to identify the key operational and functional gaps within Green Valley Medical Center. The identified gaps provide the foundation for the proposed solution and guide the definition of business requirements and future business processes.

Gap Assessment

Business Area	Current State	Desired State	Gap Identified	Business Impact	Recommendation
Patient Management	Patient information stored across multiple spreadsheets.	Centralized patient records.	No integrated patient database.	Duplicate records and inconsistent information.	Implement a centralized patient management module.
Appointment Scheduling	Manual scheduling using Excel.	Integrated scheduling system.	No centralized scheduling platform.	Double bookings and administrative delays.	Implement a digital appointment management module.

Medical Records	Clinical notes stored separately.	Electronic Health Record (EHR) system	No centralized clinical history.	Limited access to patient information.	Implement an Electronic Health Record system.
Laboratory	Laboratory requests managed manually.	Integrated laboratory module.	No automatic association between results and patients.	Delayed communication of results.	Integrate laboratory management into the platform.
Billing	Payments managed separately.	Integrated billing system.	Financial data disconnected from appointments.	Manual reconciliation and reporting.	Integrate billing and payment management.
Reporting	Reports manually created.	Automated reporting and improved operational visibility.	Limited operational visibility.	Slow decision-making.	Implement reporting and business intelligence capabilities.

Gap Summary

The analysis identified significant gaps between the clinic's current operational environment and the desired future state. The primary gaps relate to fragmented data management, manual business processes, lack of system integration, and limited reporting capabilities. Addressing

these gaps will improve operational efficiency, enhance data quality, and support informed decision-making across the organization.
