

Current State Analysis (As-Is)

Purpose

Analyze and document the current operational processes, systems, data, and business challenges of Green Valley Medical Center before proposing improvements.

Business Overview

Green Valley Medical Center is a medium-sized outpatient healthcare clinic located in Dublin, Ireland. The clinic provides multidisciplinary healthcare services through several medical specialties and supporting administrative departments. Daily operations rely on manual spreadsheet-based processes, resulting in fragmented information management and limited operational visibility.

Business Summary

Category	Details
Departments	General Medicine, Cardiology, Neurology, Gastroenterology, Pulmonology, Pediatrics, Orthopedics, Gynecology, Endocrinology, Dermatology, Laboratory, Administration, Finance, Management.
Services	General consultations, specialist consultations, preventive care, laboratory testing, diagnostic services, minor procedures, vaccinations, health screenings, chronic disease management, nutrition counseling, physiotherapy, psychology, and follow-up appointments.

Main Stakeholders	Clinic Director, Project Manager, Reception Staff, Healthcare Providers, Laboratory Staff, Finance Team, IT Vendor / Solution Provider, Administrative Staff, and Patients.
Current Systems	Microsoft Excel spreadsheets for patient records, appointment scheduling, billing, laboratory results, provider management, and reporting. Communication is primarily handled via phone calls and email, with no centralized Practice Management or Electronic Health Record (EHR) system.

Key Business Metrics

Metric	Value
Healthcare Providers	48
Medical Specialties	10
Clinic Locations	1
Average Daily Patients	Approximately 150
Appointment System	Excel
Integrated EHR	No

Provider Distribution

Gastroenterology and Pulmonology have the highest number of providers (7 each), followed by Orthopedics, Gynecology, and General Practice (6 each). Dermatology and Endocrinology have only one provider each, indicating a lower service capacity in these specialties.

Current Business Environment

Current Operating Model

The Green Valley Medical Center currently operates through a combination of manual processes and standalone Microsoft Excel spreadsheets. Each department manages its own operational data independently, resulting in fragmented information and limited visibility across the organization. Core business activities such as patient registration, appointment scheduling, billing, laboratory result management, and provider administration are maintained in separate files with no automated integration between them.

Communication between departments relies primarily on email, telephone calls, and manual information sharing. Staff members frequently re-enter the same information into multiple spreadsheets, increasing the risk of data inconsistencies, duplication, and human error. Operational reporting is performed manually, requiring significant effort to consolidate information from different sources before management can access meaningful business insights.

Although the current processes support day-to-day operations, the absence of an integrated Practice Management and Electronic Health Record (EHR) system limits operational efficiency, data quality, and timely decision-making.

Current Operating Characteristics

Area	Current Situation
Patient Registration	Managed manually using Excel spreadsheets.
Appointment Scheduling	Scheduled through standalone spreadsheets without real-time availability.
Medical Records	Patient information is distributed across multiple files.
Laboratory Results	Recorded separately and manually shared with healthcare providers.

Billing & Payments	Managed independently from appointments and patient records.
Reporting	Reports are manually consolidated from multiple spreadsheets.
Communication	Email, telephone calls, and face-to-face communication between departments.
Data Integration	No automated integration between operational datasets.

Operational Observations

- Business information is stored across multiple independent spreadsheets.
- Departments operate with limited visibility of information maintained by other teams.
- Manual data entry increases the likelihood of duplicate records and data inconsistencies.
- Management reporting requires manual consolidation of operational data.
- The current environment provides limited support for business analytics and performance monitoring.
- The lack of a centralized EHR system reduces operational efficiency and scalability.

Current Systems Inventory

The Green Valley Medical Center currently relies on a collection of independent Microsoft Excel spreadsheets to manage its daily operations. Each operational area maintains its own dataset, resulting in fragmented information and limited integration between business functions. The absence of a centralized healthcare management platform requires manual coordination and frequent data reconciliation.

System	Purpose	Primary Users	Current Limitations
Patient Records Spreadsheet	Stores patient demographic information and contact details.	Reception Staff	Manual updates and limited validation.
Provider Records Spreadsheet	Maintains healthcare provider information and specialties.	Administration	Not integrated with scheduling or patient records.

Appointment Management Spreadsheet	Records scheduled consultations and appointment details.	Reception Staff	No real-time availability or automated scheduling.
Payment Records Spreadsheet	Tracks patient payments and billing information.	Finance Team	Operates independently from appointments.
Laboratory Results Spreadsheet	Stores laboratory test requests and results.	Laboratory Staff	Results are manually shared with healthcare providers.
Department & Service Lists	Maintains reference information for departments and medical services.	Administration	Static reference data with manual maintenance.

Current Business Processes

The clinic's daily operations are supported by several independent administrative processes. Information is manually entered and maintained across multiple spreadsheets, requiring staff to transfer data between departments throughout the patient journey.

The primary operational processes include:

- **Patient Registration** – Patient demographic information is manually recorded before receiving medical services.
- **Appointment Scheduling** – Reception staff schedule appointments using standalone spreadsheets based on provider availability.
- **Medical Consultation** – Healthcare providers access patient information and record consultation outcomes separately from scheduling data.
- **Laboratory Services** – Laboratory requests and results are managed independently and communicated manually to clinicians.
- **Billing and Payments** – Financial transactions are recorded separately from appointment and patient information.
- **Operational Reporting** – Management reports are produced through manual consolidation of multiple spreadsheets.

These processes currently function independently, resulting in duplicated effort and limited visibility across departments.

Current Data Assessment

The assessment of the current datasets indicates that operational information is available but dispersed across multiple files. While the existing spreadsheets support daily activities, they provide limited controls for data quality, validation, and integration.

Assessment Area	Current Status
Data Availability	High
Data Consistency	Medium
Data Quality	Medium
Data Validation	Limited
Data Standardization	Partial
Duplicate Records	Possible
Data Integration	None
Reporting Capability	Manual
Data Accessibility	Department-specific
Scalability	Limited

Observation

The current data structure provides sufficient operational information to support daily business activities. However, the lack of centralized data management increases the risk of inconsistencies and limits the organization's ability to generate reliable operational insights efficiently.

Current Challenges

The analysis of the current operating environment identified several challenges that impact efficiency, collaboration, and data management across the organization.

Challenge	Business Impact
Independent spreadsheets	Fragmented information across departments.
Manual data entry	Increased risk of human error and duplicate records.

Lack of system integration	Information must be manually transferred between business areas.
Limited data validation	Greater likelihood of inconsistent or incomplete records.
Manual reporting	Management reports require significant manual effort.
Limited operational visibility	Difficult to monitor business performance in real time.
Inefficient communication	Staff rely on email and telephone to exchange operational information.
Limited scalability	Current processes become increasingly difficult to manage as the clinic grows.
