

Requirements Elicitation

i This document summarizes the initial business needs identified through stakeholder interviews and analysis of the current business environment. These needs provide the foundation for the definition and refinement of business and functional requirements during the Business Analysis phase.

Patient Management

Centralized Patient Database

The system shall maintain a centralized patient database containing demographic information, contact details, medical history, GP referrals, and other relevant patient information.

Patient Registration

The system shall allow reception staff to register new patients and update existing patient records through a standardized electronic form.

Data Validation

The system shall validate mandatory fields and prevent users from entering invalid or incorrectly formatted data during patient registration.

Patient History

The system shall provide healthcare professionals with access to each patient's consultation history, including previous appointments, attending providers, diagnoses, and clinical notes.

GP Referrals

The system shall record and manage General Practitioner (GP) referrals required for specialist consultations.

Appointment Management

Appointment Scheduling

The system shall provide a centralized appointment scheduling module for all departments.

Provider Availability

The system shall display provider availability to support appointment scheduling.

Appointment Categories

The system shall distinguish appointments using color coding based on department, appointment type, and follow-up consultations.

Follow-up Appointments

The system shall allow reception staff to schedule follow-up appointments immediately after the completion of a consultation.

Clinical Management

Electronic Medical Records

The system shall allow healthcare providers to create, update, and maintain electronic medical records for each patient.

Clinical History

The system shall provide access to previous clinical notes recorded by authorized healthcare providers.

Laboratory Integration

The system shall associate laboratory requests and laboratory results with the patient's electronic medical record.

Laboratory History

The system shall maintain a complete history of laboratory tests requested and completed for each patient.

Medical Documents

The system shall allow healthcare providers to generate electronic prescriptions, referral letters, medical certificates, and other patient documents.

Financial Management

Payment Recording

The system shall allow staff to register patient payments associated with appointments and medical services.

Payment Status

The system shall display the payment status for each scheduled appointment.

Provider Payments

The system shall generate payment reports for healthcare providers based on completed services.

Reporting & Analytics

Operational Reports

The system shall generate reports showing the number of consultations and follow-up appointments by department.

No-show Analysis

The system shall generate reports identifying appointment no-show rates by department.

Patient Demographics

The system shall generate demographic reports based on patient information.

Revenue Reports

The system shall generate revenue reports by medical service and healthcare provider.

Laboratory Reports

The system shall generate reports showing laboratory tests performed and the associated revenue.

Enterprise Integration

Centralized Information

The system shall provide a centralized platform integrating patient records, appointments, billing, laboratory information, and clinical documentation into a single solution.

Observations

The requirements and business needs identified in this document represent the initial findings from stakeholder interviews and analysis of the current business environment. They will be refined, prioritized, and validated during the Business Analysis phase before being formalized in the Business Requirements Document (BRD) and related requirements specifications.
